

PROFILING OF PROTEASE SPECIFICITY USING COMBINATORIAL FLUOROGENIC SUBSTRATE LIBRARIES

ABSTRACT OF THE DISCLOSURE

A method is presented for the preparation and use of fluorogenic peptide
5 substrates that allows for the configuration of general substrate libraries to rapidly identify
the primary and extended specificity of enzymes, such as proteases. The substrates contain a
fluorogenic-leaving group, such as 7-amino-4-carbamoylmethyl-coumarin (ACC). Substrates
incorporating the ACC leaving group show comparable kinetic profiles as those with the
traditionally used 7-amino-4-methyl-coumarin (AMC) leaving group. The bifunctional
10 nature of ACC allows for the efficient production of single substrates and substrate libraries
using solid-phase synthesis techniques. The approximately 3-fold increased quantum yield of
ACC over AMC permits reduction in enzyme and substrate concentrations. As a
consequence, a greater number of substrates can be tolerated in a single assay, thus enabling
an increase in the diversity space of the library. Soluble positional protease substrate libraries
15 of 137,180 and 6,859 members, possessing amino acid diversity at the P4-P3-P2-P1 and P4-
P3-P2 positions, respectively, were constructed. Employing this screening method the
substrate specificities of a diverse array of proteases were profiled, including the serine
proteases thrombin, plasmin, factor Xa, uPA, tPA, granzyme B, trypsin, chymotrypsin,
human neutrophil elastase, and the cysteine proteases papain and cruzain. The resulting
20 profiles create a pharmacophoric portrayal of the proteases allowing for the design of
selective substrates and potent inhibitors.
